

# append() vs appendChild() JavaScript

The append() method accepts :

- Node Objects  
→ which are element nodes, text nodes etc.
- DOMStrings  
→ which are plain text in quotes.

The appendChild() method only accepts

- Node Objects

⇒ Note :

append() Allows Us To Add Multiple Node Objects At Once Unlike appendChild()

append() allows you to add multiple items while appendChild() allows only a single item.

⇒ Note :

append() will put your element in the last off childs while appendchild() will put your element ascendingly
